

Part A - Two Paragraphs: What was your individual contribution to this project? Did you apply and build upon the skills identified in your initial assessment from last Fall? What did you do and how did you do it? What did you learn and what competencies did you build? What were your successes, what were your obstacles?

My individual contribution to this project was a combination of the frontend UI, and AI model endpoint. The mode serves as a way to grade user submissions to our website project and auto rank them as a solution to the problem of user apathay toward city cleanup and maintenance. The skills that I both applied and built upon from my initial assessment were primarily in the areas of software development and machine learning. I utilized my knowledge of programming languages such JavaScript to develop the frontend interface and Python to integrate it with the AI model. This utilized and improved my skills in several areas from plain writing code all the way to developing web api's and through the emerging data science space as model training and development experience.

We faced several obstacles during the project, including challenges in integrating the AI model with the frontend and ensuring that the user interface was intuitive and user-friendly. However, through collaboration with my teammates and persistent problem-solving, we were able to overcome these obstacles and successfully implement our solution. One of my successes was being able to effectively communicate and collaborate with my team members, which was crucial in ensuring that our project was cohesive and well-integrated.

Part B – Two Paragraphs: What did your group accomplish? What did you learn about group work? What aspects of teamwork were successful and what aspects of teamwork were not successful? How did your efforts on the project compare to that of your teammates? Do any team members deserve special recognition?

Our group accomplished the successful development and deployment of a web application that encourages user engagement in city cleanup efforts. We integrated an AI model to grade user submissions and rank them based on their effectiveness in addressing the problem of user apathy toward city maintenance. Through our collaborative efforts, we were able to create a functional and user-friendly platform that promotes community involvement and civic responsibility.

My efforts on the project were comparable to those of my teammates, as we all contributed significantly to different aspects of the project. Each team member brought unique skills and perspectives that were essential to our success. We had effective communication and collaboration throughout the project, which allowed us to overcome obstacles and achieve our goals. If any members of our team deserve special recognition it would be Zach Reising. His knowledge and experience in React enabled our group to work as a much more cohesive unit and without him almost every aspect of this project would have been substantially more difficult to accomplish.
